

My military service was in the U. S. Army (ASA) as an communications intercept operator overseas.

In Sept 2004 I will have accumulated 50 years in the Amateur Radio Service.

I have found over the recent years that more and more the FCC is willing to sacrifice good engineering practices over budgetary concerns.

BPL will negate any future endeavors to use "weak signal" reception in the presence of the added BPL RF pollution.

The predominate motive for implementing BPL, supposedly, is to utilize existing infra-structure to the benefit of commerce.

This amounts only to a transfer of monetary responsibility from internet providers to the general public.

Internet providers are in a win-win situation at the expense of other interests and not only those involving the Amateur Radio Service and the U.S. Military Intelligence Community.
